

Candidate Profile of Tom Jing for the role of Full Stack Developer

Tom brings professional full stack software engineering experience, including interesting work within a complex internet business in China called Mecai before relocating to New Zealand. He interviewed well and comes across as intelligent, composed and personable with good written and verbal English language skills.

Tom came to New Zealand to complete a Master's Degree in IT Project Management which he has done. He took time away from his career to study and is now looking for a permanent role in Java Software Development. He is working part time at the Auckland Institute of Technology as a lecturer and also provides free lance software development work for an online business in China.

Technically, he is a Java specialist, with over a decade of experience in Java, Spring, and RESTful API development. His experience extends into microservices and distributed systems, including handling data consistency, distributed transactions, log tracing, and service governance.

He has followed disciplined development practices across coding standards, branching strategies, CI/CD pipelines, deployment and rollback processes, and technical documentation.

Tom has strong exposure to security-driven development, having worked under China's MLPS (Multi-Level Protection Scheme), a framework comparable in some ways to ISO27001. His day-to-day responsibilities included implementing secure coding practices, SQL injection prevention, JWT and API security, data encryption, sensitive-data masking, and backup and recovery strategies. This background gave him a solid grounding in application, data, and operational security.

Tom maintains an active freelance portfolio, which includes the development of an online education platform built with Spring Boot and Vue, showcasing his ability to deliver end-to-end solutions and maintain production systems.

Salary expectations: \$90,000 - \$100,000
Notice period: 2 weeks' notice
Visa: 3 year post study work visa

Tom Jing

Open Work Visa (Full Working Rights in NZ)

Profile

Senior Software Engineer with 10+ years of experience designing and building large-scale, high-availability distributed systems in high-traffic environments.

Strong expertise in Java, Spring Boot, RESTful API design, and microservices architecture, with hands-on experience delivering core backend systems for large internet platforms serving millions of users. Also experienced in frontend development using React and Vue, enabling full-stack collaboration and feature delivery.

Experienced in complex business modelling, system integration, and leading backend delivery within cross-functional teams. Seeking backend or full-stack software engineering roles in New Zealand.

Career History

Teaching Assistant (Part-time), Auckland University of Technology (AUT), Auckland, New Zealand Mar 2026 - Present

- Assisted in lab sessions for the **Data Structures** and **Algorithms** course, supporting students in implementing core data structures and algorithms using **Java**.
- Guided students in understanding concepts such as arrays, linked lists, stacks, queues, sorting, and searching algorithms.
- Helped students debug **Java programs**, analyze algorithm logic, and resolve programming issues.
- Explained time complexity concepts and helped students improve algorithm efficiency and problem-solving skills.

Senior Software Engineer, MEICAI, China Jul 2020 - Jun 2024

- MEICAI is a Chinese tech company that provides fresh produce and food supply services to restaurants through a digital platform.

- Designed and implemented the architecture of a modular Warehouse Management System (WMS) using **Spring Boot**, enabling parallel development and seamless integration of inbound, outbound, processing, sorting, and inventory modules.
- Designed and delivered **RESTful APIs** supporting RF (handheld) warehouse operations, enabling real-time inbound, outbound, picking, and inventory workflows for on-site operators.
- Designed a **Canary** strategy based on an **RPC (DUBBO)** protocol to reduce the risks associated with new release deployments.
- Utilized **MQ (Apache RocketMQ)** technology to implement asynchronous task processing, reducing peak-time server load and improving business success rates.

Education

Master of IT Project Management, Auckland University of Technology, Auckland, New Zealand

Mar 2025 - Dec 2025

Master of Computer Science and Technology, China Agricultural University, Beijing, China

Sep 2005 - Feb 2008

Bachelor of Computer Science and Technology, Tsingtao Agricultural University, Tsingtao, China

Sep 2001 - Jul 2005

Skills

- Core Backend Skills:

- Java, Spring Boot, RESTful API
- MyBatis/Hibernate (ORM)
- Apache Dubbo, Thrift (RPC)
- Groovy (DSL), Linux

- Databases

MySQL, MongoDB, HBase

- Infrastructure & Messaging

- Redis, Kafka, RabbitMQ, RocketMQ, Zookeeper
- Nginx, Tomcat

- DevOps & Tooling

- Maven / Gradle, Git, CI/CD, Jenkins

- Frontend Skills:

- JavaScript, jQuery, Bootstrap, JSP, HTML/CSS
- Vue, React, Next.js

- Implemented **distributed transaction** mechanisms and compensation strategies to ensure **eventual data consistency** across multiple services.
- The WMS system (excluding database and middleware servers) was deployed across **12** service nodes, supporting the operation of around **70** warehouses nationwide and **5,000+** suppliers, with daily throughput exceeding **100,000** orders and average GMV of approximately RMB **40 million** per day.

Senior Software Engineer, MEITUAN, China

Feb 2016 - Aug 2019

- MEITUAN is one of China's largest technology platforms, offering services such as food delivery, hotel booking, and travel. It serves hundreds of millions of users and is a leader in the local life services industry.

- Designed and led the development of a domestic flight API platform from scratch, **integrating 20+** airline systems and standardizing different APIs and data formats into a unified interface.
- Implemented a **Java + Groovy (DSL)** hybrid architecture to separate stable core logic from airline-specific logic, significantly improving system maintainability and scalability, and reducing airline **integration time from 8 days to 5 days**.
- Abstracted flight-ticket workflows into seven core business domains (Price Query, Price Verification, Order Creation, Payment, Ticket Number Query, Refund/Change, and Refund Details) and offered a unified integration approach for the airline systems.
- Leveraged **MQ (Kafka)** to decouple asynchronous callback logic between systems, resolving update and deployment issues caused by circular dependencies.
- Served as the core system for MEITUAN's domestic flight flagship platform, supporting **20+** airlines, processing **10,000+** orders per day, deployed on **12** servers, with high availability (**99.99% SLA**), and later used as a reference by the international flight team.

Full-Stack Software Engineer, JIUXING, China

Oct 2014 - Feb 2016

- JIUXING is a technology company focused on the new energy vehicle industry, providing data service solutions for vehicle connectivity and charging infrastructure.

- Designed and implemented a data service platform for **IoT-based** new energy vehicles, enabling unified monitoring and data collection for charging stations and electric vehicles.
- Built frontend monitoring pages using **jQuery** and **Bootstrap** to visualize real-time vehicle data and device status.
- Used the **MQTT** protocol as the data communication standard and **RabbitMQ** message queues to transfer data from devices to the server.
- Implemented a distributed lock mechanism based on **Redis** to ensure concurrency safety in the card payment module.
- Used **MongoDB** to store large-scale telemetry data, adopting a sharded cluster to improve system availability and query performance.
- Used **ZooKeeper** both as a centralized configuration service and as a high-availability coordination solution for the monitoring service.
